

SMARTER Access Control

Smarter Access Control is a powerful solution for managing access to your business properties. When combined with intrusion, video, and energy, this solution offers your business an all-in-one security solution.

With powerful multi-site management, swipe to disarm, expiring access, access history reports and bulk user management, you can easily manage a wide range of access control and intrusion setups — all through an user-friendly website and mobile app.

Key Benefits

With our Smarter Access Control solution, you can:

- Manage everything from one app
- Easily buzz, lock, and unlock doors from anywhere
- Receive personalized alerts when a door is opened or never closed

- Manage users and create access plans with schedules for different user groups
- Instantly revoke user access to the security system and all doors

- Easily open and close your business with Scenes
- Review your property's event history
- Seamlessly integrate with security, video, and automation solutions

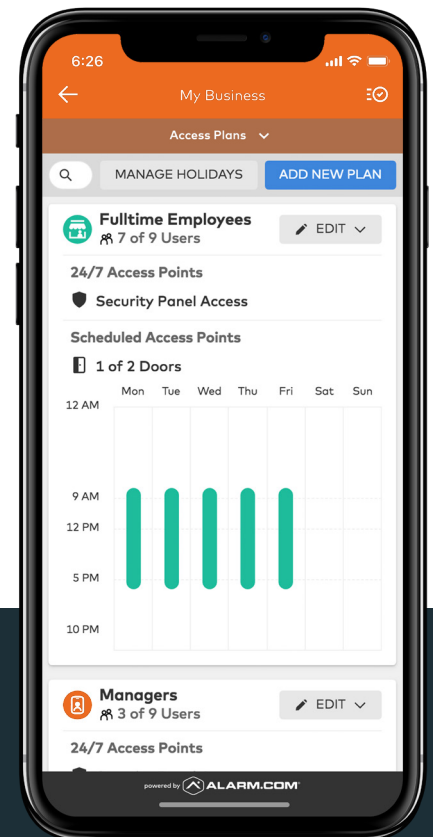

Hardware

Use industry-standard access control hardware to bring systems online.

Smarter Access Control supports the following hardware:

- Any Wiegand reader
- Any card frequency (must match the reader used)
- Any relay-controlled locking hardware

- Any exit device with a relay output
- Most unencrypted, non-proprietary card formats, including standard 26 bit formats

Access Control

How It Works

Seamless integration with the Smarter Access Control solution helps you keep your business secure, while also giving you awareness into access events and key operational activities.

6:58 AM - At a dentist's office

Dr. Hoffman gets an alert, and is reassured that his office will be ready to open on time at 7:30 AM.

Video clip provides visual verification that it's an employee arriving to prepare for the day.

One badge swipe unlocks the front door and disarms the security system.

First Person In rule automatically unlocks and locks the front door based on business hours.

1:17 PM - At a multi-location retail store

John, the regional manager, sets up access for 12 new employees starting next week.

John uses bulk user management to easily add all the employees to the new location.

Managers and employees are given different access privileges.

The employees' access cards are scheduled to start working the day that they start.

6:24 PM - At a high school

The IT manager receives an unusual activity alert for the chemistry lab.

She pulls up the access activity page and filters activity to the lab door.

Finding the unexpected activity, she clicks through to the SVR video recording showing theft of lab equipment.

The employee's access permissions are revoked and 1 year of their access history is exported for the school's records.

8:15 PM - At a local café

Olivia can easily close up shop with the push of one button.

The front, back, stock room and office doors lock.

The neon "Open" sign in window turns off.

The security system arms away.
